Log

Note: when graphing, better to use the non-log version of a variable and add scale_x_continuous() and scale_y_continuous().

However, when we are graphing means, this is not possible. Would graph log(mean(var)) rather than mean(log(var)), which is what we prefer.

```
train <- train %>%
  mutate_at(vars(real_gross, real_budget, director_facebook_likes, cast_total_facebook_likes, imdb_scor
```

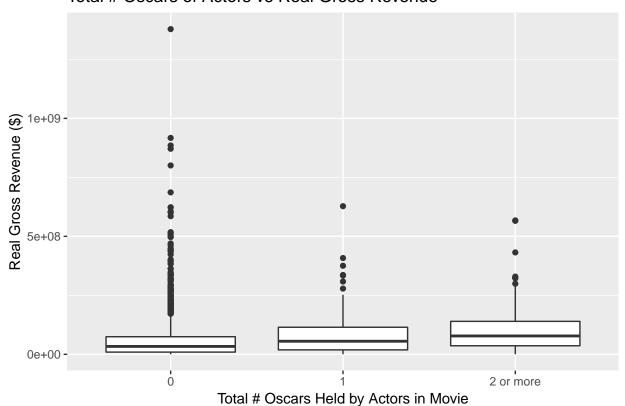

Oscars

Graph number of Oscars for actors and directors against real revenue. Boxplot and bar plot (average revenue) Both are linear but very weak. Unclear if should include in model

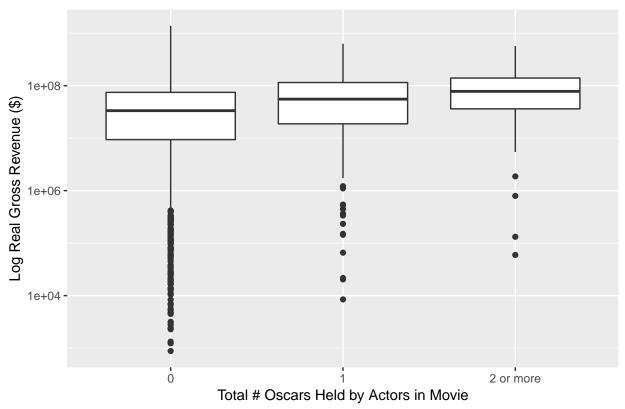

```
# Versions of data with average revenue by number of oscars
train_oscar_actor <- train %>%
  group_by(total_oscars_actor) %>%
  summarize(avg_real_gross = mean(real_gross),
            avg_real_gross_log = mean(real_gross_log))
train_oscar_director <- train %>%
  group by(total oscars director) %>%
  summarize(avg_real_gross = mean(real_gross),
            avg_real_gross_log = mean(real_gross_log))
# Functions to graph number of Oscars held by actors in 1movie vs. real revenue
# boxplot
oscar_box <- function(df, var, title_str, x_str) {</pre>
  plt_base <- ggplot(df, aes_string(var, "real_gross")) +</pre>
    geom_boxplot()
  print(plt_base +
    labs(title = title_str, x = x_str, y = 'Real Gross Revenue ($)'))
  print(plt_base +
    labs(title = title_str, x = x_str, y = 'Log Real Gross Revenue ($)') +
      scale_y_log10())
}
# bar graph
# can't do scale y log10() with average
oscar_bar <- function(df, var, title_str, x_str) {</pre>
 print(ggplot(df, aes_string(var, "avg_real_gross")) +
```

```
geom_col() +
  labs(title = title_str, x = x_str, y = 'Average Real Gross Revenue ($)'))
print(ggplot(df, aes_string(var, 'avg_real_gross_log')) +
  geom_col() +
  labs(title = title_str, x = x_str, y = 'Average Log Real Gross Revenue (Log $)'))
}
# actors
oscar_box(train, 'total_oscars_actor', 'Total # Oscars of Actors vs Real Gross Revenue', 'Total # Oscar
```

Facebook Likes

Graph total cast facebook likes and director facebook likes vs real gross revenue. Continuous, so scatter plot. Trying log versions too.

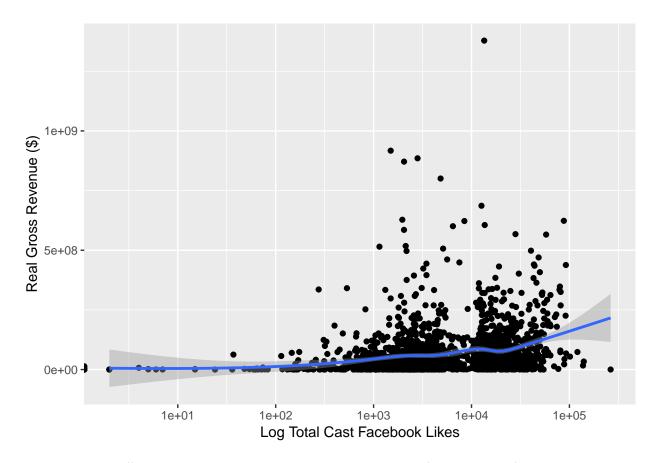

Not as strong a relationship as I originally expected. Not sure this is worth including either.

```
facebook_plot <- function(xvar, xlab) {</pre>
 base_plt <- train %>%
    ggplot(aes_string(x = xvar, y = 'real_gross')) +
    geom_point() +
    geom_smooth()
  print(base_plt +
    labs(x = xlab, y = 'Real Gross Revenue ($)'))
  print(base plt +
          labs(x = str_c('Log ', xlab), y = 'Real Gross Revenue ($)') +
          scale_x_log10())
  print(base_plt +
          labs(x = xlab, y = 'Log Real Gross Revenue ($)') +
          scale_y_log10())
  print(base_plt +
          labs(x = str_c('Log ', xlab), y = 'Log Real Gross Revenue ($)') +
          scale_x_log10() + scale_y_log10())
}
facebook_plot('cast_total_facebook_likes', 'Total Cast Facebook Likes')
```

Year

Average real revenue vs year

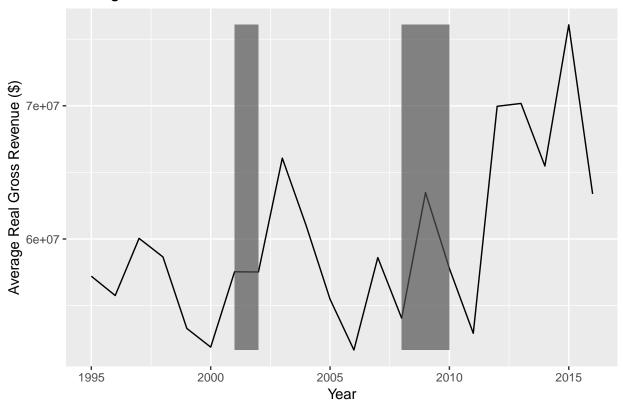

Adeed APPROXIMATE recession shading. Annual data, so hard to do.

Real revenue increase during recessions, but then decreases as recession worsens? (have seen this before with Great Depression - numerous articles we can reference)

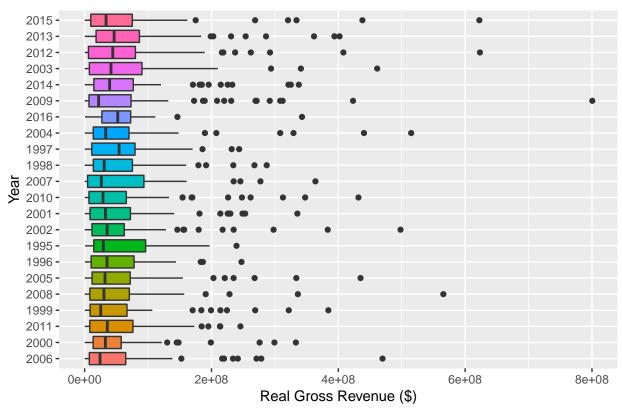

Regardless, clear that year could have an effect

```
# take average of revenue per year: how does revenue evolve over time?
train_sum <- train %>%
  group_by(year) %>%
  summarize(real_gross_avg = mean(real_gross))
# need to limit because before 1995 there are very few observations per year (< 10 usually).
# this causes large spikes because one high earning or low earning movie influences the average heavily
# Starting at 1995, where have at least 30 (or very close) movies per year. Now can see movements over
ggplot(data = train_sum %>% filter(as.integer(as.character(year)) >= 1995)) +
  geom_line(aes(x = as.integer(as.character(year)), y = real_gross_avg)) +
  labs(title = 'Average Real Gross Revenue Over Time', x = 'Year', y = 'Average Real Gross Revenue ($)'
    geom_rect(aes(xmin = 2008, xmax = 2010,
                ymin = min(real_gross_avg, na.rm = T),
                ymax = max(real_gross_avg, na.rm = T)), alpha = .05) +
  geom_rect(aes(xmin = 2001, xmax = 2002,
                ymin = min(real_gross_avg, na.rm = T),
                ymax = max(real_gross_avg, na.rm = T)), alpha = .05)
```

Average Real Gross Revenue Over Time

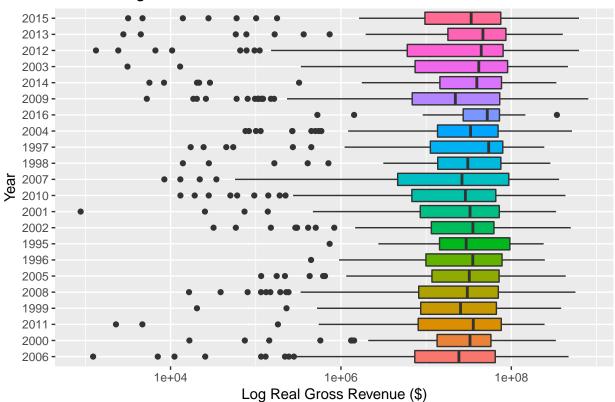

```
plt_base +
  labs(x = 'Year', y = 'Log Real Gross Revenue ($)',
     title = 'Year vs Log Real Gross Revenue') +
  scale_y_log10()
```

  title = 'Year vs Average Log Real Gross Revenue') +
  theme(legend.position = 'none') +
  coord_flip()
```

Content Rating

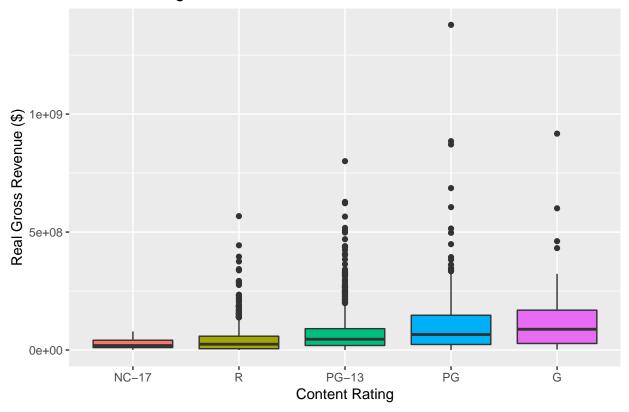

Bar graph of average real revenue and boxplot

Linear relationship. Good candidate to include in the model Each individual rating has an significantly different average mean real revenue

```
# data manipulation. Factor.
train_content <- train %>%
    # filter out missing
filter(!is.na(content_rating)) %>%
    # reorder content rating based on gross
mutate(content_rating = reorder(content_rating, real_gross))

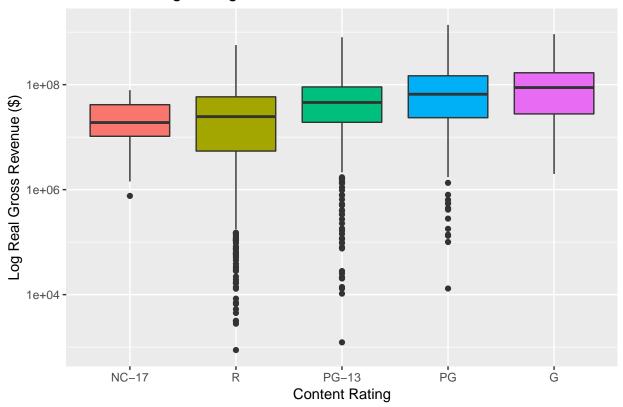

# boxplot
plt_base <- train_content %>%
ggplot() +
geom_boxplot(aes(x = content_rating, y = real_gross, fill = content_rating)) +
theme(legend.position = 'none')
plt_base +
labs(x = 'Content Rating', y = 'Real Gross Revenue ($)',
    title = 'Content Rating vs Real Gross Revenue')
```

Content Rating vs Real Gross Revenue

Genre

Bar graph of genre vs real revenue. Try boxplot and bar graph against average real revenue. Fairly linear relationship. Good candidate to include in model.

```
# untidy the genre data such that one obseration is spread across many rows. Easier to graph
genre_cols <- c('Action', 'Adventure', 'Animation', 'Biography', 'Comedy', 'Crime', 'Documentary',</pre>
                 'Drama', 'Family', 'Fantasy', 'History', 'Horror', 'Music', 'Musical', 'Mystery', 'Romance', 'SciFi', 'Sport', 'Thriller', 'War', 'Western')
train_genre <- train %>%
  # gather: one row per genre-movie combo
  gather(genre_cols, key = genre, value = yes) %>%
  # only keep when 'yes' is 1 (yes it is of that genre) %>%
  filter(yes == 1) %>%
  # reorder genre by real_gross
  mutate(genre = reorder(genre, real_gross))
# boxplot
plt_base <- train_genre %>%
  ggplot() +
  geom_boxplot(aes(x = genre, y = real_gross, fill = genre)) +
  coord_flip() +
  theme(legend.position = 'none')
plt_base +
